TITLE: On the function of effectiveness of shielding materials with respect to capture  
gamma-radiation 14

SOURCE: Voprosy fiziki zashchity reaktorov (Problems in physics of reactor shielding);  
sbornik statey, no. 2. Moscow, Atomizdat, 1966, 164-169

TOPIC TAGS: radiation shielding, radiative capture, gamma radiation

ABSTRACT: The authors compare experimental and theoretical data on the function of  
effectiveness of shielding materials with respect to capture  $\gamma$ -radiation in nickel. 27  
The function of effectiveness is expressed as a linear combination of quantities of the  
type  $h_{Ap}$

$$f(x) = h_{Ap} - \frac{\rho_B}{\rho_A} h_{Bp}$$

where  $\rho_A$  and  $\rho_B$  represent the concentrations of the respective components in the shield-

Card 1/3

L 05057-67  
ACC NR: AT6027932

ing materials. This function shows the change which takes place in the functional  $J_{n,1}$  when a unit of substance B is substituted for a unit of substance A where

$$J_{n,1} = \sum_i \beta_i k_i \iiint \frac{\Phi(r, \mu, E)}{4\pi r^2} \Sigma_{n,1}(r, E) e^{-\int_0^r \mu^1(r') dr'} B_i d\mu dE dV$$

describes the production and yield of capture  $\gamma$ -radiation. In this formula  $\Phi(r, \mu, E)$  is neutron flux;  $\Sigma_{n,1}(r, E)$  is the macroscopic cross section of radiation neutron capture;  $\beta_i$  is the yield of  $\gamma$ -quanta of given energy  $E_i$  per captured neutron;  $k_i$  is the dose created by a unit flux of  $\gamma$ -quanta of energy  $E_i$ ;  $\mu^1(r)$  is the total coefficient of linear absorption of  $\gamma$ -quanta of initial energy  $E_i$ ;  $B_i$  is the dose factor for accumulation of  $\gamma$ -quanta of initial energy  $E_i$ . The function  $f(x)$  was experimentally studied by introducing a hydrogen-containing substance into a nickel screen made up of sheets measuring  $80 \times 80 \times 0.8$  cm for an overall thickness of 25 cm. This specimen was surrounded by a neutron shield for reducing the background. A single-crystal scintillation gamma-spectrometer with a crystal of sodium iodide was used for measuring the number of capture  $\gamma$ -quanta with an energy of greater than 7 Mev produced by radiation capture of neutrons in the nickel. Curves are given showing neutron hazard functions with respect to capture  $\gamma$ -radiation. These functions describe the contribution of neutrons to the stream of  $\gamma$ -quanta behind the screen as a function of the neutron energy and inlet coordinate. The results show that the addition of hydrogen-containing material through nearly the entire thickness of the nickel layer increases the inten-

3  
sity of capture  $\gamma$ -radiation behind the screen. An exception to this rule is the first  
6 cm of nickel where the neutron hazard function for low energy particles is less than  
the function for high energy neutrons so that a good moderator placed at these points  
reduces the intensity of capture  $\gamma$ -quanta behind the screen. The authors thank V. V.  
Orlov, V. Ya. Pupko and S. G. Tsypin for interest in the work. Orig. art. has: 4

"Synthetic Metallurgical Powder for Martin Furnaces," A. S. Berezhnuy, V. I. Mitsov,  
I. G. Fadeyev, Factory imeni Serov and All-Union Institute of Refractory Materials, 2 pp

"Stal'" Vol VII, No 5

It is difficult to use magnesium metallurgical powder in Martin furnaces, even when it is combined with slag. Berezhnuy, at the Institute of Refractory Materials, has discovered a synthetic metallurgical powder (for example, basifrite, tomasite and some others). Its production is not being made public. However, does describe repair work done to furnaces.

TITLE: The development of the process of smelting ball bearing steel in acid open-hearth furnaces. (Usovershenstvovaniye vyplavki sharikopodshipnikovoy stali v kislykh martenovskikh pechakh).

PERIODICAL: "Stal'" (Steel), 1957, No.6, pp.503-507 (USSR).

ABSTRACT: Results of investigations of the influence of various technological factors on the content of non-metallic inclusions in ball bearing steel produced in acid open-hearth furnaces of the Serov Works are described. The influence of the following factors was studied: A) Quality of the starting materials. It was established that the contamination of steel by sulphide inclusions is more uniform than that with oxide inclusions and depends mainly on the sulphur content in the starting materials and the fuel. This contamination increases with increasing sulphur content in steel (Fig.1) and increasing temperature of the metal during tapping (Fig.2). For the above reasons only high quality pig and the purest materials as well as low sulphur fuel oil are being used for the production of this steel. The optimum temperature of metal in runner during tapping 1525-1530 C. B). Carbon content at the end of the melting

Card 1/5

The development of the process of smelting ball bearing steel in acid open-hearth furnaces. (Cont.) 133-6-7/33

period. Analysis of the dependence of the content of oxide inclusions on the concentration of carbon at the end of the melting period indicated that the best results are obtained at a carbon content 1.5 - 1.7% (based on data collected from 175 heats). C) Manganese practice. On the basis of data collected from a large number of heats, it was established that the contamination of metal by inclusions decreases with increasing manganese content in metal after the end of the melting and increasing content of manganese oxide in slag. Therefore, the manganese content at the end of melting should be not lower than 0.25%, during the first hour of boiling not lower than 0.16-0.18% and during the second hour of boiling not lower than 0.22%. The manganese content required is maintained by its reduction from slag and additions of manganese ore during smelting and only in exceptional cases when the above limits cannot be maintained, by ferromanganese additions. D) Slag practice. Statistical analysis of the data collected indicated that the optimum content of ferrous oxide in slag after the end of the melting period should be within the range of 16-26%. An increase in the  $MnO + FeO$

Card 2/5

The development of the process of smelting ball bearing steel in acid open-hearth furnaces. (Cont.) 133-6-7/33

content of slag before deoxidation decreases the contamination by oxide inclusions. Therefore,  $FO + MnO$  content before deoxidation should not be lower than 36%. Iron oxides content in slag is controlled by additions of sand or scale. E) Comparison of the quality of steel made by the active or silicon reduction process. The comparison of the results of microcontrol indicated that with increasing reduction of silicon at the end of the heat the contamination of steel by non-metallic inclusions increases. Therefore, the reduction of silicon should not exceed 0.16%.

F) Alloying of steel (tube billets) with medium carbon ferrochromium. The use of medium carbon ferrochromium XP-1 and XP-2 instead of high carbon XP-6 considerably decreased the contamination of steel by carbide inclusions. (Table 1).

G) The influence of aluminium. This was studied by varying the amount of aluminium added to the ladle from 0.1 to 0.5 kg/ton (Fig.3). On the basis of the results obtained (data on 142 heats) an aluminium addition of 0.2 kg/ton was introduced. H) The use of complex deoxidants and other reagents.

About 40 modifications of deoxidising methods were tested (AMC alloy, silicocalcium, silicozirconium, ferrovanadium

Card 3/5

The development of the process of smelting ball bearing steel in acid open-hearth furnaces. (Cont.) 133-6-7/33 and combinations of the above alloys) as well as treatment of metal in the runner with other reagents (soda, crushed electrodes, etc.). However, positive results were obtained only by deoxidation with silicocalcium (up to 1 kg/ton addition to furnace before ferrochromium and 1-1.5 kg/ton addition to ladle during tapping). As a result of the above improvements the proportion of defects found on the works as well as on consuming works decreased (Table 2). Frequency curves of the degree of oxide contamination of forged semis 90 x 90 mm from metal produced with and without the application of silicocalcium are shown in Fig.4. A comparison of the contamination of steel with oxide and sulphide inclusions produced in electric and open hearth furnaces is shown in Figs. 5 and 6. Acid open hearth steel is less contaminated by oxide inclusions and somewhat more contaminated by sulphide inclusions than basic electric steel. I) Changes in the degree of contamination along the height of an ingot. This problem was studied on specimens from forged semis 90 x 90 mm taken from rolled strip in places corresponding to the top, middle and bottom (2% from the back end) of an ingot. The results

Card 4/5

The development of the process of smelting ball bearing steel in acid open-hearth furnaces. (Cont.) 133-6-7/33 of micro-control (Table 3) indicated a practically uniform distribution of oxide inclusions and somewhat higher contamination by sulphide inclusions of the top of the ingots tested. The results of a more detailed examination of the degree of contamination of metal published by M.I. Vinograd ("Non-metallic inclusions in ball bearing steel", Metallurgizdat, 1954) are quoted: the higher degree of contamination by oxides - 10-15% of the height from the bottom of an ingot; middle and top part of an ingot are approximately equally contaminated. The middle part of the ingot is somewhat more contaminated by sulphide inclusions. It is concluded that due to the above studies and improvements in the technology of smelting the proportion of rejects was decreased 2-3 times. There are 3 tables, 6 figures and 1 Slavic reference.

TITLE: Mass Flow Catalyst Lifting (Transport katalizatora sploshnym potokom)

PERIODICAL: Khimiya i Tekhnologiya Topliva i Masel, 1958, Nr 11, pp 15 - 20 (USSR)

ABSTRACT: The catalyst, adsorbent or contact mass circulates in a closed system during continuous catalytic and contact processes. The circulation of the catalyst can be carried out most reliably by pneumatic transport. Conditions have to be selected at which the deterioration of the transported solid phase is minimal. The deterioration also depends on the concentration of the solid phase in the current and decreases with increasing concentration. The authors constructed an experimental plant (Fig.1), and discuss results obtained during these experiments (Table 1). Table 2: velocities of the gas current and of the particles at which this process can be carried out. Experiments proved that the described method can be applied for the circulation of catalysts with various dimensions of granules. High-load capacities can be achieved at small diameters of the pipes.

Card 1/2

SOV/85-58-11-4/15

Mass      Flow      Catalyst      Lifting

When using this process in industrial plants of 40 - 70 m height, the required pressure lies between 5 - 7 atms. This indicates that compressors can be used. Further experiments will show the possibility of formulating equations for the calculation of systems in which the specific load can be increased. There are 3 Figures, 3 Tables and 5 References: 4 Soviet and 1 English.

TITLE: Development of the Technology of Smelting and Teeming of High Chromium Nickel-molybdenum Steel (Usovershenstvovaniye tekhnologii vyplavki i razlivki vysokokhromistoy nikel'molibdenovoy stali)

PERIODICAL: Stal', 1958, Nr 2, pp.120-126 (USSR)

ABSTRACT: In view of the high proportion of defective semis (up to 12.85%) and finished articles (13.75%) from the above steel, an investigation of the causes of defects and methods of their prevention was carried out. As a result of this investigation smelting and ingot teeming practices were developed which reduced the proportion of defective semis to 7.6% and of finished articles to 1.5-2.2%. An investigation of the nature of the defects indicated that in the majority of cases they were related to the presence of oxide inclusions. Steel was normally produced in 135 ton basic open hearth furnaces. It was necessary to add to the burden during deoxidation and alloying, about 6.5% of ferroalloys which cooled the metal considerably and the steel with high chromium content (2.45-2.85%) becomes

Card 1/3

155-2-5/19

Development of the Technology of Smelting and Teeming of High Chromium Nickel-molybdenum Steel.

viscous. Moreover, ferroalloys contained a large proportion of high melting inclusions. Therefore in 1951 the production of this steel was transferred to 75 ton acid open hearth furnaces, but no substantial improvement was obtained. A statistical study of operating data indicated that the main factor determining the proportion of defects on manufacturing works was the temperature of steel during teeming. With increasing temperature the proportion of defects decreases (Fig.1). Studies of the distribution of non-metallic inclusions in ingots indicated that the main cause of defects in finished articles were non-metallic inclusions and hair cracks (Figs.2, 3, 4). In order to increase the temperature of the metal on teeming, the technology of its production was modified, namely the addition of chromium was carried out in 2-3 portions during the boiling period. The procedure and the results obtained are described in some detail. In order to decrease the proportion of rejects due to surface defects four methods of teeming were tested:

1) teeming without frames with observation on the behaviour

Card 2/3

153-2-5/19

Development of the Technology of Smelting and Teeming of High Chromium Nickel-molybdenum Steel.

of "crust" in all 4 moulds; 2) teeming with frames on all 4 moulds without observation on the behaviour of metal in moulds during the process of their filling; 3) teeming with frames in 3 moulds and the observation of the behaviour of metal in the fourth mould and 4) teeming with frames in all four moulds, but with the observation and control of the velocity of filling in one mould until it is one third full. The results obtained (Table 4) indicated that the fourth method was the most suitable. The following participated in the work: P.P.Semenenko, V.A. Nosov, L.Ya.Sukhman, L.A.Magidson and V.Ye.Sokolov. There are 4 tables, 5 figures and 8 Russian references.

TITLE: The Use of Martenite for Repairs of the Bottom of Open-  
hearth Furnaces (Primeneniye martenita dlya remonta  
podin martenovskikh pechey)

PERIODICAL: Stal', 1958,<sup>18</sup> Nr 7, pp 604 - 606 (USSR)

ABSTRACT: In conjunction with the beginning of production of martenite on the "Magnezit" works, its suitability for repairs of open-hearth bottoms was tested as since previous tests in 1946-1947, operating conditions of open-hearth furnaces have changed (intensification of the smelting process). The tests were carried out on the Serov Works on 135-ton furnaces with magnesite-chromite and mixed roofs, fired with a carburised mixture of blast-furnace and brown coal-producer gas, operating the scrap ore process with 55-60% of hot pig. Usually, repairs of bottoms were done every 8 days. Chemical composition and size distribution of the martenite used for the tests - Table 1, and data on the tests - Table 2. A comparison of the chemical composition of sintered samples, taken from furnace bottoms, repaired with martenite and with a magnesite open-hearth slag

Card1/2

SCV/133-58-7-5/27

The Use of Martenite for Repairs of the Bottom of Open-hearth  
Furnaces

mixture - Table 3. The use of martenite decreased by 0.7% the time required for repairs due to a faster sintering of the second layer, as martenite sinters approximately twice faster than the usual mixture of magnesite with slag. The results obtained were satisfactory. For further improvement of martenite, a decrease in its silica content and an increase in magnesia content is recommended. There are 3 tables and 3 Soviet references

TOPIC TAGS: quality steel, steel teeming, steel melting, metallurgical furnace

PURPOSE AND COVERAGE: This book reports on the results of work on improving the technology of melt'ng, deoxidation, and teeming of quality steels in electric arc, acid and basic open-hearth furnaces conducted at the Izhevsk Metallurgical Plant and the Sverdlovsk Metallurgical Combine. Great attention is given to description of the measures to reduce contamination with nonmetallic inclusions of ball bearing and structural steels, presentation of material on the effectiveness of teeming steel under a liquid slag, and to increasing the output of sound metal from the ingots due to the use of various methods of heating their hot top. The results of using rare earth elements for deoxidation and modification of steel are given.

1109. Mineralogical analysis of Sathin crystalline magnesites. — M. I. FADEV (Ogneupory, 16, 448, 1951). The Sathin deposits contain magnesite, dolomite, calcite, quartz, shungite, talc and pyrites. The difficulty in distinguishing the carbonates in a micro-investigation was overcome by use of an organic pigment (diphenyl carbazide, which is adsorbed by magnesite alone) for the preparation of sections. The accessory minerals in Sathin magnesite include calcite, talc, chlorite-penninite, quartz, pyrites, sphalerite, brucite, and shungite. (2 tables.)

 TITLE : Comparative Evaluation of the Methods of Trichinoscopy of Thawed Meat and the Degree of Infection of Badger Muscles with Trichinella  
 ORIG. PUB. : Izv. Bashkirsk. s.-kh. in-ta, 1957, 3, No 2, 357-362  
 ABSTRACT : The trichinoscopy of thawed meat with preliminary treatment of sections with a mixture of stains composed of two parts of 3% solution of bluing and one part of 1% solution of rivanol in 30% of acetic acid (one drop per section) produced the best result. The highest amount of trichinellae in 24 sections of the muscles of the badger, weighing 0.3 g, was found in the sections from

Moscow. Vyssheye tekhnicheskoye uchilishche

Tekhnologiya priborostroyeniya; sbornik statey (Instrument-making Technology; Collection of Articles) Moscow, Oborongiz, 1958. 185 p. (Series: Its: /Trudy/ vyp. 90) 3,800 copies printed.

Ed.: A.N. Malov, Candidate of Technical Sciences; Chief Ed.: A.S. Zaymovskaya, Engineer; Ed. of Publishing House: E.A. Shekhtman; Tech. Ed.: N.A. Pukhlikova.

**PURPOSE:** This collection of articles is intended for workers in scientific and research institutes and instrument manufacturing plants and for teachers and students in vtuzes.

**COVERAGE:** The book deals with problems of automatic machine tool adjustments. It analyzes errors in setting up cutting tools and reviews basic technological calculations connected with the introduction of programming. Several articles are devoted to the analysis of pressure in machining parts and to the assembly operations in instrument manufacturing. A brief biography of Professor Abram Borisovich Yakhin (1901-1957) precedes the first article. No personalities are mentioned. There are no references.

"Vestnik Vozdushnogo Flota" No 7 (341)

Fundamentals of bomber crew training. Stresses bombing accuracy. Errors in bombing may occur due to poor ballistics or errors in the bomb sight, therefore the bombardier must be properly prepared to overcome the more common difficulties. The article does not give any details for training bomber crews.

AUTHOR: Fadeyev N., Candidate of Technological Sciences  
TITLE: How to Design a Glider (Kak proyektirovat' planer)  
PERIODICAL: Kryl'ya Rodiny 1957, Nr. 9, pp. 26-27 (USSR)  
ABSTRACT: The purpose of the author is to advise the members and the heads of the glider-building teams of the primary DOSAAF organizations as to how the construction of gliders must be planned, and on what basis the various competing designs must be evaluated. The members of the building teams are reminded that by taking part in the building of a glider they are making their first steps as future aircraft designers, and are urged to approach their task as scientifically as possible. As books for them the author recommends: "Norms for Structural Strength of Gliders" (Normy prochnosti planerov), apparently an official guide, published in 1952; "Computation of Aerodynamic Qualities of Airplanes" (Aerodinamicheskiy Raschet Samoleta), by I.V. Ostoslavskiy and V.M. Titov, 1947; "Longitudinal Stability and Controllability of Airplanes" (Prodol'naya ustoychivost' i upravlyayemost')

samoleta), by I.V. Ostoslavskiy and G.S. Kalachev, 1951; and "Handbook for Calculation of Structural Strength of Airplanes" (Spravochnaya kniga po raschetu samoleta na prochnost'), by Astakhov, Karavayev, Makarov and Suzdal'tsev, 1954. Those charged with the selection among the projects submitted by the various members of the building teams are offered practical advice on the method of proceeding. As far as the picking out of the best suitable project as a whole is concerned, objective criteria (expressed in figures) are suggested on the basis of which the selection should be made; with respect to the choice of the most suitable designs of the larger and smaller details of the projected glider, the author recommends that the method of successive approximations should be used. The article contains no data of direct scientific interest.

Voprosy proyektirovaniya samoletov; sbornik statey (Problems in Aircraft Designing; Collection of Articles) Moscow, Oborongiz, 1959. 74 p. (Series: Its: Trudy, vyp. 108)  
Errata slip inserted. 3,100 copies printed.

Sponsoring Agency: Ministerstvo vysshego obrazovaniya SSSR.

Ed.: A.L. Gimmel'farb, Candidate of Technical Sciences, Docent; Ed. of Publishing House: K. I. Grigorash; Tech. Ed.: L. A. Pukhlikov; Managing Ed.: A.S. Zaymovskaya, Engineer.

PURPOSE: This book is intended for personnel in the design offices of aircraft plants. It may also be used by students at aviation institutes.

COVERAGE: This collection of articles describes the results of theoretical and experimental investigation connected with the determination, during the designing stage, of basic aircraft and wing parameters, total weight of aircraft and its components, type of engines and the amount of fuel. Problems of

aircraft strength and stability are also considered. No personalities are mentioned. References appear in the text.

TABLE OF CONTENTS:

Preface

3

Fomin, N.A. [Candidate of Technical Sciences]. Methods for Determining the Basic Parameters of Aircraft and Aircraft Wings

5

The author determines basic parameters of aircraft and selects from them the most important. These are: Total weight of aircraft, wing-surface design and weight, and the necessary thrust for starting.

Gimmel'farb, A.L. [Candidate of Technical Sciences]. Calculating Necessary Fuel Supply and Total Weight of Aircraft During the Designing Stage

37

In this article the author deducts simple weight formulas based on only two static coefficients:

Card 2/4

Problems in Aircraft Designing (Cont.)

SOV/2835

weight efficiency and fuel consumption.

Fadeyev, N.N. [Candidate of Technical Science]. Comparative Evaluation of Aircraft Engines According to Their Weight in Flight

41

A method is given to help in the selection of an engine for a given aircraft and for determined régimes and flight distances

Zhevagina, A.A. [Candidate of Technical Sciences]. Determination of Critical Stresses in Laminar Compressed Panels With Veneer Covering

52

Results of an investigation show that sufficient support is formed for a thin veneer lining by a filling with the specific weight of  $0.065 \pm 0.1 \text{ gr/cm}^3$ . With this filling the panel behaves as a homogeneous body until the moment of a general loss of rigidity.

Voyt, Ye.S. [Candidate of Technical Sciences]. Stability of a Crossed-Bar Assembly Which Has Been Compressed in One Direction

59

The author is concerned with the plane and curved

AUTHOR: Fadeyev, N. N., Candidate of Technical Sciences  
TITLE: Utilization of Helicopters for the Ventilation of Open Pits  
PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Gornyy zhurnal, 1960, No. 1, pp. 92-95

TEXT: Docent I. P. Kuznetsov (Ref., Footnote on p. 92) has suggested that helicopters be used for the ventilation of open pits. This suggestion is discussed here. It is shown on the strength of Fig. 1 that the current produced by the rotor of the helicopter standing motionless in the air is a vertical air column thrust downward at a certain velocity. The rotor works like a ventilator without body and without guide tubes. It thrusts down a concentrated air column, but no such concentrated current arises on the suction side. The helicopter body reaches the thrust-down jet, slows it down and reduces the efficiency of the jet. If the helicopter is not very high over a horizontal surface, the air jet will spread out uniformly in all directions, with velocity decreasing with the

of Open Pits

distance from the jet center (Fig. 2). Better results could be achieved if the helicopter were moving along the open pit: the thrust-down jet would then spread out along the ground and especially in the direction opposite to the helicopter movement. In the ventilation of open pit slopes the fresh-air current would move from the upper edge of the slope toward the lower edge. It is assumed that for the ventilation of stepped slopes the helicopter would have to move from the open pit edge toward the center, or an alternative would be the operation of several helicopters simultaneously (Fig. 6). It is important in this connection that the conveyed fresh air aerates the foul-air zone completely. It is pointed out that the ventilation of open pits by means of helicopters requires a further theoretical and, above all, experimental investigation. There are 6 figures and 1 Soviet reference. ✓

AUTHOR: Fadeyev, N.N., Candidate of Technical Sciences  
TITLE: Theoretical formula for the weight of a trapezoidal wing  
SOURCE: Moscow. Aviationsionnyy institut. Trudy. no.138, 1961.  
Metody priblizhennykh raschetov i vybora parametrov pri proyektirovanii samoletov. 28-47  
TEXT: The paper deals with a method for determining the weight of a trapezoidal wing, by basing the solution on theoretical formulae, and using statistics to obtain correction factors. The weight of the surface skinning and structure of the spars is determined with and without the relieving effect of a number of differing factors such as distributed and concentrated loading. It is assumed that air loads are proportional to the chord, and that the relative thickness of the wing varies along the span. Corrections to this accepted chordwise law, based on curves established by Kh.S. Bleykh (Ref.5: "Tekhnika vozdushnogo flota", 1942, no.4) for the bending moments and transverse forces acting on trapezoidal wings, are applied to the weight of the surface
